CMX'S CLAYTON GEOPHYSICAL PROGRAM STARTED, PRIVATE PLACEMENT OFFERING

Calgary, Alberta – September 10, 2026 -- CMX Gold & Silver Corp. ("CMX" or the "Company") (Canadian Securities Exchange: CXC), confirms commencement of its inaugural exploration program on its 100%-owned Clayton Silver Project in Idaho, USA. DIAS Geophysical is conducting detailed 3DIP and Magnetotelluric (MT) geophysical surveys over the Company's patented and unpatented mining claims. CMX is expecting to receive results by mid to late October 2026.

Jan Alston, CEO of CMX stated, "This is a significant step to advance the potential of the historic Clayton Silver Mine. During the mine's 50-year operating life, there was no geophysical work or systematic exploration drilling to expand the potential beyond the single known vein. Mining stopped in 1986 because of low silver prices. We expect that the geophysics will identify quality drill targets on newly identified veins within the mineralized system and extend the existing vein that is open to depth and to the north."

Rick Walker, CMX's VP, Exploration added, "The Clayton mine is a carbonate replacement deposit (CRD). In addition to being a CRD, the structural environment also typically provides opportunity to discover additional mineralization as *en echelon* (parallel), fault-controlled veins. We anticipate the geophysical results will provide sub-surface targets and, through subsequent drilling, potentially provide additional mineral resources. That is our objective."

On July 9th, 2026, CMX announced closing a $910,000 first tranche of its non-brokered private placement of $0.25 units comprised of one share and one share purchase warrant exercisable at $0.40 per share for two years from closing. The Company expects to close a second tranche in September 2026. The units are being sold to "accredited investors" and other exempt parties pursuant to exemptions from prospectus requirements under Canadian securities laws. All securities issued under the private placement are subject to a statutory hold period expiring four months and one day after the closing date, as set out in National Instrument 45-102 (Resale of Securities). The offering remains subject to regulatory approval and the approval of the Canadian Securities Exchange.

The Clayton Silver Property

The Clayton Silver Project is CMX's 100%-owned flagship asset, located in the Bayhorse Mining District of central Idaho, approximately 30-40 kilometers south-southwest of Challis. The property comprises a 1,028-acre land package, including 29 patented mining claims and two patented mill sites (approximately 562 acres) and 20 unpatented claims (approximately 466 acres). The patented claims provide surface ownership rights, carry no government royalties, and do not require drilling permits.

The comprehensive geophysical program covers the historic mine and surrounding structures, comprised of a 3DIP survey and a Magnetotelluric (MT) survey. These surveys are intended to delineate known and identify new vein structures, identify extensions of partially mined ore bodies, and evaluate deeper sources of mineralization, with follow-up diamond drilling planned to test priority targets.

The Clayton Silver Mine operated from 1935 to 1986 and was one of the most active underground mines in the district. Recorded production totaled approximately 7 million ounces of silver, along with lead, zinc, copper, and minor gold, from an estimated 2.15 million tonnes of ore. Underground development reached eight levels to a depth 1,100 feet, with nearly 19,700 feet of workings, and partially mined two tabular ore bodies known as the South and North Ore Bodies (Hillman, Bob, M.S. Thesis, June 26, 1986, Eastern Washington University). Mine records and historical drilling indicate that mineralization remains open to depth and along strike. Notably, drill hole 1501-A intersected 22 feet (true width not known) of high-grade polymetallic mineralization at approximately 1,425 feet, confirming continuity below the deepest historic workings. CMX has determined that little modern geophysical work or systematic exploration drilling was conducted during the mine's operating life.

Technical and scientific information in this news release was reviewed and approved by Richard Walker, M.Sc. (Geology), P.Geo., Vice President, Exploration of CMX, who is recognized as a Qualified Person under the

guidelines of National Instrument 43-101. Readers are cautioned that historical information referenced in this news release is not NI 43-101 compliant but has been obtained from sources that the Company believes are reliable.

None of the securities sold in connection with the Offering will be registered under the United States Securities Act of 1933, as amended, and no such securities may be offered or sold in the United States absent registration or an applicable exemption from the registration requirements.
