Leocor Mining Completes VTEM airborne EM survey at Copper Creek, Baie Verte, Newfoundland

Vancouver, British Columbia – September 10, 2026 – Leocor Mining Inc. (the “**Company**” or “**Leocor**”) (CSE: **LECR**, OTCQB: **LECRF**; Frankfurt: **LGO0**) (formerly Leocor Gold Inc.), a junior resource company focussed on the exploration and development of precious metals projects in Eastern Canada, is pleased to report the completion of a VTEM[™] Plus airborne EM survey (the “**Survey**”) by Geotech Ltd. (“**Geotech**”) at the Company’s Copper Creek prospect (the “**Prospect**”), located within the Company’s 2,002-ha contiguous Baie Verte gold-copper exploration package. The Baie Verte project (“**The Project**”) is situated on the north central coast of the island of Newfoundland in the province of Newfoundland and Labrador, Canada.

The Survey follows up the Company’s maiden 2025 drilling campaign on the Prospect which succeeded in identifying stockwork chalcopyrite mineralization interpreted to represent feeder type mineralization of a Volcanogenic Massive Sulphide (“**VMS**”) mineralizing system. In addition to stockwork chalcopyrite mineralization the program identified additional hallmarks of VMS systems including anomalous zinc mineralization and lenses of massive and semi-massive pyrite.

Results of the 2025 drilling campaign are disclosed in Company news release dated July 8th, 2025, titled: “Leocor Mining Drills 3.6m of 1.49 %Cu, Including 0.9m of 3.22 %Cu within 6.1m of 0.99 %Cu, at Copper Creek.”

"The completion of this survey is an important step in the continued development of our Baie Verte ground," said Alex Klenman, CEO. "These results will play an important role in identifying priority targets for our next phase of field exploration. Our Baie Verte project is in a highly prospective district, and we look forward to advancing exploration there," Mr. Klenman added.

About VTEM™ Plus

Geotech Ltd.'s proprietary VTEM™ Plus system is a helicopter-borne time-domain electromagnetic technology that maps subsurface variations in electrical conductivity and magnetic susceptibility. The system is highly effective for VMS exploration because dominant sulfide minerals, including chalcopyrite and pyrite, display strong electrical conductivity contrasts against unmineralized host rocks. VTEM™ Plus uses a low base operating frequency to penetrate to depths up to 500 meters.

About the Project

The Baie Verte Peninsula has a well documented mineral endowment which includes several past producing VMS mines. Bedrock geology of the project area includes mafic volcanic and metasedimentary sequences of the Notre-Dame Subzone of the Dunnage Zone of the Newfoundland Appalachians. The Notre-Dame Subzone is characterized by Ordovician submarine bimodal volcanics, metasedimentary rocks and ophiolite sequences from a volcanic arc environment. This geological setting is consistent with the development of exhalative and replacement type VMS deposits. The most notable occurrences within the Notre Dame Subzone on the Baie Verte Peninsula include the past producing Terra Nova, Rambler, and Tilt Cove Mines. Figure 2 below outlines notable mineral deposits within the Baie Verte Peninsula.

About Leocor Mining Inc.

Leocor Mining Inc. is a British Columbia-based resource company involved in the acquisition and exploration of precious metal projects, with a current focus in Atlantic Canada. Leocor, through outright ownership and earn-in agreements, currently controls several gold-copper projects in prime exploration ground located within the prolific Baie Verte Mining District. Leocor's Baie Verte portfolio includes the Dorset, Dorset Extension, Copper Creek and Five Mile Brook projects, creating a contiguous ~2,000-hectare exploration corridor.
