## **Copper One Visually Identifies Native Copper in Ongoing Drilling at 100%-Owned Redonda Copper-Molybdenum Project, British Columbia**

**Vancouver, BC – September 09, 2026 – Copper One Resources Corp. ("Copper One") (CSE: CEXY | OTCID: CEXYF | FSE: IW8 | WKN: A42AGR) (the "Company")** is pleased to announce that native copper has been visually identified in drill hole RED-26-02 as part of the Company's fully funded 2,400-metre diamond drilling program at its 100%-owned Redonda Copper-Molybdenum Project ("**Redonda**" or the "**Property**"), located on West Redonda Island in British Columbia's Vancouver Mining Division.

**Figure 1:** Native copper Visually Identified in drill hole RED-26-02. Visual observations are preliminary, and mineral content and grade can only be confirmed through laboratory analysis. I sharpened up this photo from the original

Hole RED-26-02, drilled at an inclination of -55 degrees and planned to reach a total downhole depth of approximately 500 metres, has advanced beyond 270 metres. The Company has visually identified native copper in its drilling at approximately 40 metres.

Geological features and visual mineralization consistent with the targeted porphyry copper-molybdenum system have been observed beginning at approximately 20 metres downhole and continuing through portions of the hole drilled to date. The identification of native copper is based on visual observation of drill core and has not yet been confirmed by laboratory analysis. Visual estimates should not be considered a substitute for analytical results, and the Company is not making any representation regarding copper grade based on these observations.

**Figure 2:** On September 8th, 2026, copper hit an intraday all time high of USD \$6.86 as reported by Google Finance.

**David Greenway, President and Chief Executive Officer of Copper One, commented:** *We are encouraged by the geological features and visual mineralization encountered in RED-26-02, including the visual identification of native copper. Importantly, these observations occur within a broader interval where geological features consistent with the targeted porphyry copper-molybdenum system have been observed beginning at approximately 20 metres downhole. With RED-26-02 now beyond 270 metres and targeting*

*a planned depth of approximately 500 metres, drilling continues to test the southern extension, geometry and continuity of the Redonda system. Visual observations are preliminary, and we look forward to reporting laboratory results as they are received and reviewed.”*

**Figure 3:** *Drill core from hole RED-26-02 at approximately 150 metres downhole showing visually observed mineralization. Visual observations are preliminary and have not been confirmed by laboratory analysis. Mineral content and grade can only be determined through analytical testing.*

Redonda hosts an underexplored porphyry copper-molybdenum system within British Columbia's Coast Suture Zone, a geological belt prospective for porphyry copper mineralization. The current drill program is testing priority targets developed through the integration of historical exploration data, airborne geophysics, recent field mapping and geological interpretation.

**Figure 4:** Location of the Planned 2026 Drill Sites at the Redonda Copper-Molybdenum Project, West Redonda Island, British Columbia.

The 2026 exploration strategy is informed by the technical report on the Redonda Property prepared by W.B. Lennan, P.Geo., and filed under the Company's SEDAR+ profile in March 2026. Mr. Lennan has reviewed the planned drill program and concurs with its objectives, targets and design.

To execute the program, Copper One has engaged Paradigm Drilling Ltd. ("**Paradigm Drilling**"), which has deployed a Boyles T-75 hydraulic, track-mounted diamond drill equipped with NQ tooling and capable of testing targets to depths exceeding 600 metres (1,969 feet).

The Redonda Copper-Molybdenum Project comprises nine mineral claims covering approximately 2,746 hectares (6,786 acres) on West Redonda Island in British Columbia's Vancouver Mining Division. Exploration conducted since the late 1960s

has identified multiple copper-molybdenum mineralized zones that remain open along strike and at depth. Historical exploration by Teck Resources Ltd. (formerly Teck Corp.) in 1979 included nine NQ diamond drill holes totaling 1,681 metres (5,515 feet).

The current drilling is focused on evaluating the extent of the known mineralized system and testing priority targets identified through the Company's integrated geological and geophysical interpretation. In addition, recent field observations have identified what may represent a previously unrecognized mineralized zone exposed along a historic logging road east of the main trend. This area will be systematically mapped and sampled and may become an additional drill target, subject to analytical results.

To support the program, Copper One has engaged experienced porphyry copper geologist Bernhardt Augsten, P.Geo., who is overseeing geological logging during the campaign.

## **Engagement with the Klahoose First Nation**

Copper One is committed to working collaboratively with the Klahoose First Nation ("**Klahoose**") throughout the 2026 exploration campaign, with an emphasis on local employment, training opportunities and the engagement of Klahoose-owned and affiliated businesses wherever practicable. As part of this commitment, the Company has engaged a Klahoose member to perform core splitting and will utilize the Klahoose crew boat for marine transportation during the program.

The Company will maintain ongoing communication with Klahoose regarding exploration activities, work schedules and project milestones. Exploration activities will be conducted in accordance with applicable cultural heritage protocols and environmental best practices, with Copper One continuing to identify opportunities to support skills development, capacity building and meaningful economic participation as exploration advances.

## **About Redonda**

The Redonda Copper-Molybdenum Project is a district-scale porphyry copper-molybdenum exploration project located on West Redonda Island in British Columbia's Vancouver Mining Division. The project comprises nine mineral claims covering approximately 2,746 hectares (6,786 acres) and is situated within the highly prospective Coast Suture Zone, a geological belt known for significant porphyry copper and skarn mineralization.

Redonda lies within the Coast Suture Zone between the Wrangellia Terrane and the Coast Plutonic Complex. Early Cretaceous dioritic intrusions of the Coast Plutonic Complex are cut by at least three later intrusive phases: (i) a quartz plug; (ii) a wide, hornblende-rich dike locally brecciated over approximately 600 metres (1,969 feet) of exposed length; and (iii) several smaller feldspar dikes near the southwestern margin of the hornblende body. Copper-molybdenum mineralization is most concentrated along the hornblende dike, particularly within brecciated zones. The geological setting shares several characteristics with nearby porphyry systems, including the OKover copper-molybdenum deposit located approximately 34 km (21 miles) to the southeast (north of Powell River) and the Gambier Copper deposit in Howe Sound.

## **Qualified Person**

The scientific and technical information contained in this news release has been reviewed and approved by Larry Segerstrom, M.Sc. (Geology), CPG, a non-independent consulting geologist to the Company and a Qualified Person as defined by National Instrument 43-101 – Standards of Disclosure for Mineral Projects.

## About Copper One Resources Corp.

Copper One Resources Corp. is focused on identifying, acquiring, and advancing high-potential copper, copper-silver-gold, and copper-molybdenum projects to help meet the growing global demand for critical metals required for electrification, AI infrastructure and data centres, renewable energy, defence, and the modernization of power systems.

The Company's flagship asset is the Majuba Hill Copper-Silver-Gold District, located approximately 156 miles (251 kilometres) from Reno, Nevada. Majuba Hill is an exploration-stage porphyry copper project situated in a premier mining jurisdiction with excellent infrastructure, where ongoing exploration is focused on evaluating the scale and continuity of a large copper-silver-gold mineralized system.

Copper One also owns a 100% interest in the Redonda Copper-Molybdenum Project, located northeast of Campbell River in British Columbia's Vancouver Mining Division. The district-scale project comprises approximately 2,746.46 hectares (6,786 acres) across nine mineral claims and hosts a porphyry-style copper-molybdenum system within the highly prospective Coast Suture Zone, a geological belt known for significant porphyry copper and skarn mineralization. The Company believes Redonda has the potential to become a significant long-term exploration asset as systematic exploration continues to evaluate the scale and continuity of the mineralized system.

In addition, Copper One holds an option to earn up to a 100% interest in the Redhill Property, located south of Ashcroft, British Columbia, adjacent to the Trans-Canada Highway. The 4,736-hectare (11,704-acre) property hosts volcanogenic massive sulphide (VMS) mineralization prospective for copper, zinc, silver and gold, while also demonstrating potential for epithermal gold mineralization.

Subject to completion of the proposed acquisition of Rooinek Mining Corp. ("**Rooinek**") (see news release dated [July 20, 2026](#)), Copper One will also own the Sport Project in Utah, expanding the Company's portfolio of North American copper exploration assets.

Copper One is advancing its portfolio through systematic exploration, modern geological modelling, and disciplined technical evaluation. The Company remains committed to responsible exploration practices, technical transparency, and creating long-term shareholder value through disciplined exploration and the advancement of critical metals projects across North America.

**Forward-Looking Information**

*This news release contains certain forward-looking statements and forward-looking information (collectively, "forward-looking statements") within the meaning of applicable Canadian securities laws. Forward-looking statements are generally identified by words such as "anticipates," "believes," "expects," "intends," "plans," "proposes," "estimates," "may," "will," "could," "should," "potential," "targets" and similar expressions.*

*Forward-looking statements in this news release include, but are not limited to, statements regarding the continuation, timing, scope and completion of the Company's planned 2,400-metre diamond drilling program at the Redonda Copper-Molybdenum Project; the planned depth of the current drill hole; the completion of drilling from four initial drill sites and the potential addition of further drill holes or targets; the timing and receipt of assay results; future geological observations, core logging, sampling, mapping and laboratory analysis; the testing and potential extension of the known copper-molybdenum system to the south; the interpretation, orientation, geometry, continuity, strike length, scale and significance of mineralization at Redonda; the potential identification and evaluation of a newly exposed mineralized zone; future exploration activities and technical studies; continued engagement with the Klahoose First Nation; and the Company's ability to advance its mineral projects and obtain sufficient financing for future exploration programs.*

*These forward-looking statements are based on management's current expectations, estimates, assumptions and projections as of the date of this news release. Such assumptions include, without limitation, that the Company will be able to continue and complete the planned 2,400-metre drill program as currently contemplated; that the current drill hole will reach its planned depth; that assay results will be received within anticipated timelines; that required personnel, drilling equipment, contractors, services, permits and financing will remain available on acceptable terms; that site access, weather and operating conditions will permit exploration activities to proceed without material disruption; that engagement with the Klahoose First Nation will continue as anticipated; and that the Company's geological interpretations will continue to be supported by additional exploration data.*

*Forward-looking statements involve known and unknown risks, uncertainties and other factors that may cause actual results, performance or achievements to differ materially from those expressed or implied by such statements. These risks and uncertainties include, among others, delays in drilling, sampling or receiving assay results; the possibility that assay results may not confirm visual observations or geological interpretations; changes to drill targets or exploration plans based on new information; operational and technical difficulties; availability and cost of drilling equipment, contractors and qualified personnel; adverse weather, marine-access or site conditions; permitting, environmental and regulatory risks; Indigenous consultation and engagement requirements; fluctuations in commodity prices and financial markets; the speculative nature of mineral exploration; the absence of a defined mineral resource at Redonda; the Company's ability to obtain financing on acceptable terms or at all; and other risks associated with the mineral exploration industry. Additional risk factors are described in the Company's continuous disclosure filings available under its profile on SEDAR+ at [www.sedarplus.ca](http://www.sedarplus.ca).*

*There can be no assurance that the forward-looking statements will prove to be accurate, as actual results and future events could differ materially from those anticipated. Readers are cautioned not to place undue reliance on forward-looking statements. The Company undertakes no obligation to update or revise any forward-looking statements as a result of new information, future events or otherwise, except as required by applicable securities laws.*
